                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) -modified cationic peptide. The modification of peptides with APO increases their activity against tumour ceils, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon.
                                                                                                                                                                                                                                                                                           25-FEB-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1;
          The present sequence represents an indolicidin analogue. The present invention describes compositions and methods for treating infection, especially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) acquired resistance; and (c) inherent resistance. The combinations of antibiotics and cationic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                 New indolicidin peptide analogues - useful for, e.g. enhancing activity of antibiotic or overcoming tolerance, acquired resistance or inherent resistance of microorganisms

provided that if Xaa1 is present, Xaa8 = Hse, Met or Met-Xaa9-Met;
and further provided that: if Xaa2 is absent, Xaa1 is absent; if Xaa3 is
absent, Xaa1 and Xaa2 are absent; if Xaa4 is absent, Xaa1, Xaa2 and Xaa3
are absent; and if Xaa5 is absent, Xaa1, Xaa2, Xaa3 and Xaa4 are absent.
The indolicidin analogues can be used to create a fusion polypeptide
consisting of the analogue linked to a peptide. The indolicidin
analogues have antimicrobial activity against gram positive bacteria,
gram negative bacteria, yeast, fungus, protozoa and viruses (e.g. HIV-1).
They are also active against helminths. The analogues can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   reducing or inhibiting growth or survival of a microorganism. They can be used for treating infections. They can also be included in a liquid such as water or an aqueous solution, e.g. contact lens solution. The analogues have potential uses in food products, and in objects such as the surface of an instrument used to prepare food or to perform surgery. Transgenic plants or animals useful in the food industry can be produced by introducing a nucleic acid molecule encoding an indolicidin analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xaa4 = Xaa5 = Xaa6 = Xaa7 = Xaa8 = Xaa9 = Xa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Xaa2 =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   consists of an indolicidin analogue linked to another peptide. Peptides AAY57109 Y57138 and AAY57143-Y57144 are new indolicidin analogues, which have a homoserine residue and/or a truncated amino terminal region. The analogues have the following amino acid sequence:
                       Falla TJ,
                                                                                                                                                                                            23-AUG-1996;
                                                                                                                                                                                                                                                    06-MAR-1997.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a specifically claimed novel isolated CC cationic peptide which has antimicrobial activity. The amino acid CC sequence of antimicrobial cationic peptides (including the present CC sequence) is selected from: XIXIPTOXXXXXPTO(XXXPTO)XXX3(X5)0; CC XIXIPTOXXXX4(X5)PTOXXXXXX; XIXIPTOXXXXXPTO(XXXPTO)XXX3(X5)0; CC XIXIXXXXXPTO(XXXPTO)XX2(X5)M; where m = 1-5; n = 1-2; o = 2-5; r CC = 0-8; u = 0-1; X1 = Ile, Leu, Val, phe, Tyr, Typ or Met; X2 = Typ or CC Pro. The peptides are preferably amidated or carboxymethylated. The CC peptides may be used in methods for inhibiting the growth of a bacterium CC or yeast, or for inhibiting an endotoxaemia or sepsis associated CC disorder in a subject. The peptides have a broad activity against the CC medically important fungus Candida albicans. In addition, the peptides are useful as antitumour agents and/or antiviral agents. The peptides CC may be used as sterilants or preservatives of materials susceptible to CC microbial or viral contamination, e.g. in processed foods to inhibit CC salmonella, Yersina and Shigella. The peptides are compact and tend to CC possess the ability to work synergistically with antibitics, and in cardition activity against the possess the ability to work synergistically with antibitics, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             aureus, Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived from the analogues may be used similarly; the compounds may also be prepared from antibiotics or antiarrythmic agents. The analogues may be used therapeutically or to coat medical devices; also they are useful as surface disinfectants, as additives to shampoo or soaps, as insecticides or herbicides, or as preservatives for foods and technical materials. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/kg. These analogues have a broader spectrum of activity than indolicidin and modification as compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      where Z = P or V; X = hydrophobic residue, preferably W; B = basic aa, preferably R or K; AA = any aa; n = 0 or I; in (II), at least 1 Z = V; in (VIII) at least 2 X = F or Y. The analogues are used to treat infections caused by bacteria (Gram positive or negative, or anaerobic); fungi (yeast or moulds); parasites (protozoa, nematodes, cestodes or trematodes) or viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (I)-(VIII)

The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, cervix, uterus, skin, prostate, liver and colon.
ANY24549 to ANY24615 represent indolicidin analogues of formula (I)-(VIII) containing up to 25 amino acids (aa): RXZXXZKB (I), (II), BBBXXXXXZKB (III), BZXXXZXBBBHQ(AA)NMILBBAGS (IV), BZXXXXZBBBHQ(V), LBBNXZNXZNRKK (VI), LKNXZXXZRRK (VII) and BBXZXXZXBBH (V), LBBNXZNXZNRKK (VI) and BBXZXXZXBBH (V), LBBNXZNXZNRKK (VI) and BRXZXXZXBBH (V), LBBNXZNXZNRK (VII) and BRXZXXZXBBH (VII) and LBNXZXXZXBH (VII) and LBNXZXXZXBH (VIII) at least 2 X = F or Y. The analogues are used to treat in (VIII) at least 2 X = F or Y. The analogues are used to treat
                                                                                                                                  Claim
                                                                                                                                                          New indolicidin analogues with antimicrobial activity and nucleic acid - vectors, transformed cells and antibodies, conjugates with polyoxyalkylene glycol and fatty acid to toxicity, useful therapeutically, as disinfectants etc.
                                                                                                                                                                                                                                                                                                                                             13-JAN-1997;

fungi (yeast or moulds); parasites (protozoa, nematodes, cestodes or trematodes) or viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola hepatica, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus aureus, Listeria, Clostridium, rotavirus and papilloma virus. Compounds derived from the analogues may be used similarly; the compounds may also be prepared from antibiotics or antiarrythmic agents. The analogues may be used therapeutically or to coat medical devices; also they are useful as surface disinfectants, as additives to shampoo or soaps, as insecticides or herbicides, or as preservatives for foods and technical materials. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/kg. These analogues have a broader spectrum of activity than indolicidin and modification as compounds

polyoxyalkylene-modified Novel pharmaceutical composition

cationic

containing c peptides,

optionally useful for

treating tumours activated

This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO)-modified cationic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically lymphoma, leukaemia, multiple myeloma, or tumours of breast, lung, ovary, carries and the contains the co uterus,

                                                                                                                                        This sequence represents a cationic peptide amino acid sequence, which can be used in the pharmaceutical composition of the invention. The invention relates to a pharmaceutical composition containing at least one activated polyoxyalkylene (APO) modified actionic peptide. The modification of peptides with APO increases their activity against tumour cells, including those with a multidrug resistant phenotype. The pharmaceutical composition can be used to treat tumours, specifically

C(Preferably R or K; AA = any aa; n = 0 or 1; in (II), at least 1 Z = V; in (VIII) at least 2 X = F or Y. The analogues are used to treat infections caused by bacteria (Gram positive or negative, or anaerobic); in (VIII) at least 2 X = F or Y. The analogues are used to treat infections caused by bacteria (Gram positive or negative, or anaerobic); in (VIII) at least 2 X = F or Y. The analogues are used to treat infections caused by bacteria (Gram positive or negative, or anaerobic); in (VIII) at least 2 X = F or Y. The analogues are used to treat infections or viruses. Typical of very many pathogens that can be controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola in Partica, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus in Controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola in Partico, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus in Controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola in Partico, Klebsiella pneumoniae, Bordetella pertussis, Staphylococcus in Controlled are Leishmania, Trypanosoma, Ascaris lumbricoides, Fasciola in Particolled from the analogues may be used similarly; the compounds may in the prepared from antibiotics or antitarrythmic agents. The analogues in a controlled in the prepared from antibiotics or antitarrythmic agents. The analogues in the prepared from antibiotics or antitarrythmic agents. The analogues are administered by injection, lavage, orally or topically, generally at 0.1-50 mg/kg. These analogues have a broader in the interval and modification as compounds in the interval and modification

                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a specifically claimed cationic peptide from the present invention. The present invention describes compositions and methods for treating infection, especially bacterial infections. The compositions and methods use cationic peptides in combination with an antibiotic agent which are then administered to a patient to enhance the activity of the antibiotic agent, to overcome: (a) tolerance; (b) activity of the antibiotic agent, to overcome: (b) tolerance; (c) inherent resistance. The combinations of antibiotics and cationic peptides can provide synergistic activity against a microorganism that is tolerant, inherently resistant, or has acquired resistance to an antibiotic agent. They can be used for killing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17-SEP-1998

                                                                                                                                           MBIII is a small (mol.wt. 1879) cationic peptide. DNA encoding MBIII has been incorporated into vector px2h-Bl, in which the replication leader (R2l) sequence of RepA (see also AAW71686) is joined to 2 Hpro peptides (see also AAW71692), to provide a vector for expression of MBIII in host cells. The invention provides controlled replication plasmid vectors (RAMP vectors) comprising a replication origin of a small cryptic plasmid and a gene encoding RepA. The vectors can reach very high levels of plasmid replication, but are not lethal to the host cell, and can be used to direct the high level expression of e.g. cytokines, antigens and therapeutic proteins.
                                                                                                                                                                                                                                                                                                                                                         Increasing plasmid copy number in a cell with the repA gene product - and an small cryptic plasmid ori sequence, useful for high level expression of e.g. cytokines, antigens or therapeutic proteins % \left( 1\right) =\left( 1\right) ^{2}
